

We wanted to free resources of our teams to focus totally on homegate and drive innovation there. The tools we use for our daily work should be easy to use and maintain without the need of a separate department whose job it is to update hardware, servers and the the Atlassian tools. Even admin work should be reduced especially in terms of user management. With the use of Atlassian Access (almost) everything is now automated and the admins only have to intervene in a few cases. Jira's Next-Gen projects let the user create projects as they like and don't need the help of admins anymore with which they can start faster with their projects and don't have to worry about the tools they are using.
