

Soumen Biswas, Team SOC Lead at NTT, would be very likely to recommend Cisco Secure Network Analytics:

Secure Network Analytics' integration with Cisco Identity Services Engine (ISE), enables us to create, enforce, and monitor role-based access control policies throughout the entire network from one place. ISE grants appropriate network access to users and devices based on advanced profiling capabilities. It then shares this data with Secure Network Analytics for more precise threat detection. Secure Network Analytics feeds user behavior back to ISE to immediately update access policies for suspicious or compromised users.
