

Secure Network Analytics diagrams really helped in troubleshooting a few network issues to determine that the issues were server related. We also did a host group automation (HGA) integration with an IP address management solution that allowed us to easily add our assets into Secure Network Analytics for better categorization and policy building. This saved us hundreds of man-hours had we done this manually. We've also been able to build custom security events that are specific to our organization, which has helped our SOC team tremendously when it comes to threat hunting.
