

Between 2014 and 2016 we saw an increase of almost 3000% of users using mobile devices and an increase of nearly 200% of users needing remote access to the network. Having been a proxy shop for years, this meant that each user outside of our walls represented an increased threat as they traveled. We had looked at solutions that forced users to VPN back into the system to gain access as well as pushing proxy PAC files to our mobile phones, but those solutions were cumbersome. Spinning up an internal DNS server and changing DHCP settings was much easier. Since we already used the Cisco AnyConnect client, we were able to push the Umbrella client to it saving our support team from having to touch 150 laptops and our MDM solution pushed the Umbrella app to the mobile devices. In a matter of days, we went from being severely hampered in protecting our mobile workforce, to completely protected.
