

Has MedHx with SmartSig ever helped to save a patient's life at your organization?

Absolutely, any time we can figure out the medications the patient is on when the patient cannot tell us (ex, stroke patient), I am able to provide that information to the team. I can quickly tell them if a patient is on a blood thinner and when alteplase might not be a good idea (major risk of head bleed if given to a patient on blood thinners). This is just 1 example. It helps us immensely in overdose situations as well if prescription medications were involved.
