

Can you provide an example of when medication history data from MedHx with SmartSig enabled your team to avoid an ADE?

There was a patient who was receiving duplicate medications from the same therapeutic drug class, one prescribed by his PCP and one by his cardiologist. He had been taking the duplicate meds for 3 months. After using MedHx we were able to intervene and have one of the meds discontinued. The drugs involved can cause potassium to be elevated. This patient had elevated potassium. Our intervention avoided a potential adverse event.
