

Can you provide an example of when medication history data from MedHx with SmartSig enabled your team to avoid an ADE?

We see countless examples of blood pressure, psych, and anticoagulant medications that were added or discontinued.

Recently, Acutane was accidentally put on a patient's med list and through MedHx and the patient interview we discovered that the patient was not taking it, so we discontinued it from the list.

I check MedHx for each new admit if orders come through before I have time to do the med rec to ensure the inpatient orders match the Medhx list. I use MedHx list for every med rec I do and in many situations it has helped the patient with recalling information as I have the drug, dose, sig all right there as well as the physician prescribing.
