

SolarWinds Log & Event Manager helps us collect logs and events from across our infrastructure and from network devices, servers, workstations, ESX hosts, databases, security devices, etc. It helps us filter our logs and create custom filters based on specific event criteria. We can easily set up alerts and actions so that we can react quickly to logs with an automated response. We use it to **prevent security threats, troubleshoot errors, manage users/groups, USB defense, and much, much more.**
