

Our FLIR cameras, both thermal and ultrasonic, have helped our company: reduce downtime on production equipment, identify air leaks in our plant-wide pneumatic systems, increase our energy savings, identify issues with our commercial ovens in our powder coat paint process, and identify failing electrical components during regular PMs of electrical cabinets stopping downtime from happening altogether. They have been a tremendous boon to our day-to-day operations and we are learning how to better use them as a tool in our processes, especially predictive maintenance.
